

Kenny Kim | Gabriel Kuettel | Justin Petry | Alyssa Williams

Project Description

HomewardFound is a web application that helps people to find their lost pets. This app will allow users to log in using their Facebook account and create a profile for their lost pet, which can be shared with the HomewardFound community, and posted to social media.

The HomewardFound community will be able to search for lost pets, post updates to the owner if they've spotted or found the pet, report if the pet has been checked into an animal hospital or shelter, and contact the owner directly to provide further information. In turn, the user can notify when the community has been found, and distribute a lost-and-found reward using a third-party payment service.

Post to the HomewardFound community about their lost pet/animal and share via social media, facebook/instagram/twitter. Our community will be able to post updates to the owner of seen location of the animal, if it has been checked in to a pound/humane society/animal hospital, or contact the owner if the animal has been found. The user can also notify the community when their animal has been found/returned home.

Users in the community can use this app to better the world by checking the site for lost pets and become their communities own vigilante superhero by returning pets to their rightful, loving owners.

APIs to be Used

Facebook API
Google Maps API

Breakdown of Tasks

Gabriel/Kenny – Front-end design/UX/UI
Alyssa/Justin- Backend/functionality
